

CAMdivision is the largest trade partner of SIEMENS Industry Software in Poland! We have received five European awards.

Since 2007 we have been offering comprehensive CAD/CAE/CAM/PLM solutions with a full implementation service based on the NX SIEMENS system. We have the most experience in Poland in the implementation of NX CAD/CAM suites and special purpose applications for the design of molds and dies, namely Mold Design and Progressive Die Design, and in the development of post-processors including virtual machine simulation. Our latest offer includes solutions for the design of composite elements – FIBERSIM and for the calculation of tooling costs – Tool Costing.

FIBERSIM is a specialized module which significantly improves their processes of designing, strength analysis and production of components based on fibrous composites. It enables the automation of arduous and repeating processes through many accessible paths of creat-

ing a new product and additionally aids fast management of the design changes coming from analysis or production departments, improving the quality of products and eliminating design errors. FIBERSIM supports many best-class CAD systems. The module can be integrated with NX CAD, CATIA and Creo software. In addition, we offer wide range of NX CAE software products for everyone, whether you are an advanced analyst, engineer and designer as well as a beginner analyst.
